

● Second Sprint Backlog

- Product Owner: Desai Fan

- sprint backlog:

Functionality to be completed:

- Data in the web pages should be linked to the database, in other words, they should be dynamic;
- A list of users who liked a certain movie should be fetched and then put in the section inside the side bar;
- A list of movies that other users also liked should be added under each movie page;
- Recent works of a specific star should be listed under each person page;
- All detail pages should be completed and directed when “showing more...” button is clicked;
- Users should be able to post their comments to a certain movie review;
- Users should be able to like or dislike a review;
- Users should be able to edit their own profile, including uploading photos as well as changing their personal introduction;
- A movie rating mechanism should be built based on the number of “likes” and the number of “dislikes”, which could be used for further recommendation features;
- Ajax techniques should be applied in every corner of our application, for example, when clicking the “like” or “dislike” button, replying to a movie review and showing a notification when one’s review got a new comment.
